# Database HW5: Practice 4

2018320205 신대성

## Index Creation and Scan

- 1. Make (and execute) three queries each of which uses seq scan, index scan, and index only scan respectively. (use the 'explain analyze')
- Seq Scan

```
assignment4=# EXPLAIN ANALYZE SELECT * FROM table1;
QUERY PLAN

Seq Scan on table1 (cost=0.00.203093.00 rows=10000000 width=53) (actual time=0.069.2179.030 rows=10000000 loops=1)
Planning Time: 0.095 ms
Execution Time: 2653.839 ms
(37개 행)

assignment4=# ■
```

Index Scan

Index only Scan

```
assignment4=# EXPLAIN ANALYZE SELECT count(sorted) FROM table1 WHERE sorted = 1999231;
QUERY PLAN

Aggregate (cost=8.74..8.75 rows=1 width=8) (actual time=0.214..0.214 rows=1 loops=1)
-> Index Only Scan using table1 sorted_idx on table1 (cost=0.43..8.70 rows=15 width=4) (actual time=0.190..0.192 rows=5 loops=1)
Index Cond: (sorted = 1999231)
Heap Fetches: 5
Planning Time: 1.298 ms
Execution Time: 0.270 ms
(67川 朝)
```

2. Make two queries using clustered index and non-clustered index. Compare their execution times.

#### Clustered Index

```
assignment4=# EXPLAIN ANALYZE SELECT sorted, rndm FROM table1 WHERE sorted > 1999231;
QUERY PLAN

Index Scan using table1_sorted_idx on table1 (cost=0.43..151.80 rows=3735 width=8) (actual time=0.039..1.234 rows=3840 loops=1)
Index Cond: (sorted > 1999231)
Planning Time: 0.159 ms
Execution Time: 1.425 ms
(4개 행)

assignment4=#
```

#### Non-clustered Index

```
assignment4=# EXPLAIN ANALYZE SELECT sorted, rndm FROM table1 WHERE unsorted > 1999231;
QUERY PLAN

Index Scan using table1_unsorted_idx on table1 (cost=0.43..16284.55 rows=4121 width=8) (actual time=0.023..4.311 rows=3765 loops=1)
Index Cond: (unsorted > 1999231)
Planning Time: 0.144 ms
Execution Time: 4.500 ms
(47개 행)

assignment4=#
```

연속된 key의 row를 가져올 때, clustered index가 non-clustered index보다 빠르다. 이는 데이터의 정렬이 sorted를 기준으로 되어있어 disk access에 시간 차이가 있기 때문이다. 3. Execute and compare the following two queries. Explain why their guery plans are different.

```
● SELECT sorted, rndm FROM table1 where sorted > 1999231 and rndm= 1005;

□ SQL Shell (psq)

assignment4=# EXPLAIN ANALYZE SELECT sorted , rndm FROM table1 where sorted > 1999231 and rndm= 1005;
QUERY PLAN

Index Scan using table1_sorted_idx on table1 (cost=0.43..161.13 rows=1 width=8) (actual time=1.323..1.323 rows=0 loops=1)
Index Cond: (sorted > 1999231)
Filter: (rndm = 1005)
Rows Removed by Filter: 3840
Planning Time: 1.369 ms
Execution Time: 1.369 ms
(67| 행)

assignment4=# ■
```

```
SELECT sorted, rndm FROM table1 where sorted < 1999231 and rndm= 1005;

SQL Shell (psq)

assignment4=# SET max_parallel_workers_per_gather = 0;

SET
assignment4=# EXPLAIN ANALYZE SELECT sorted , rndm FROM table1 where sorted < 1999231 and rndm= 1005;

QUERY PLAN

Seq Scan on table1 (cost=0.00..253093.00 rows=103 width=8) (actual time=18.862..2715.816 rows=114 loops=1)

Filter: ((sorted < 1999231) AND (rndm = 1005))

Rows Removed by Filter: 9999886
Planning Time: 0.169 ms
Execution Time: 2715.866 ms

(5개 행)

assignment4=#
```

후자가 느린 이유는 sorted의 범위가 2000000인데 1999231을 기준으로 필터링했을 때 이보다 큰 row는 얼마 없지만, 이보다 작은 row는 매우 많기 때문에 그 다음 조건인 rndm = 1005를 확인할 때 더 많은 시간이 걸리게 되는 것이다.

### B-tree and Hash

1. Create two indexes

```
□ SQL Shell (psql)

assignment4=# CREATE INDEX ON table_btree USING btree (recordid);

CREATE INDEX
assignment4=# CREATE INDEX ON table_hash USING hash (recordid);

CREATE INDEX
assignment4=# □
```

2. Run two queries. And compare the query execution plan and total execution time

비슷한 실행 시간을 보여준다.

3. Run two queries. And compare the query execution plan and total execution time

큰 실행 시간 차이와 두번째 SQL문에서 Index Scan을 사용하지 않는 것을 볼 수 있다. 순차적으로 여러 개의 row를 찾는 데에는 btree가 유효하기 때문이다. psql에서는 자동으로 인식하여 hash를 사용하지 않는 것을 볼 수 있다.

4. Update a single "recordid" field in "table\_btree". And update a single "recordid" field in "table\_noindex". Then find a difference

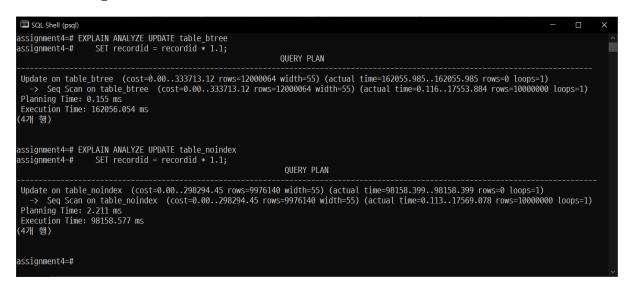

한 개의 key로 찾은 뒤에 교체하므로, btree를 이용한 index scan이 더 빠르다.

5. Update 2,000,000 "recordid" fields in "table\_btree". And update 2,000,000 "recordid" fields in "table\_noindex". Then find a difference

두가지 SQL문의 큰 실행 시간 차이가 없다.

6. Update all "recordid" fields in "table\_btree". And update all "recordid" fields in "table\_noindex". Then find a difference

table\_noindex의 update가 더 빠르다.
